# Improving the Energetic Reasoning: How I followed 15-year-old advice from my supervisor 

Claude-Guy Quimper
Université Laval, Canada

## Alejandro López-Ortiz

1967-2017

## Purposes of this talk

- To reveal some of my supervisor's greatest advice.
- To show how I still apply his advice when working my students.
- To present a O(n log ${ }^{2} n$ ) checker for the energetic reasoning

## Outline

- The Cumulative constraint
- The energetic check
- Our new checker
- The computation of energy (Advice \#1)
- Monge matrices (Advice \#2)
- Experiments (Advice \#3)
- A last advice (Advice \#4)
- Conclusion

## Definitions

## Definitions

resource

time

## Definitions

resource

- C: capacity of the resource

## Definitions

resource

- C: capacity of the resource

## Definitions

resource

- C: capacity of the resource
- p: processing time

## Definitions

resource

- C: capacity of the resource
- p: processing time
- h: height

## Definitions

resource

- C: capacity of the resource
- p: processing time
- h: height
- e: energy (e = p $\times \mathrm{h}$ )

## Definitions

resource

- C: capacity of the resource
- p: processing time
- h: height
- e: energy ( $\mathrm{e}=\mathrm{p} \times \mathrm{h}$ )
- est: earliest starting time

## Definitions

- C: capacity of the resource
- p: processing time
- h: height
- e: energy ( $\mathrm{e}=\mathrm{p} \times \mathrm{h}$ )
- est: earliest starting time
- Ict: Iatest completion time

## The Cumulative constraint

- Tasks must be scheduled between their est and lct.
- No overlap.
- The capacity of the resource is not exceeded.

## The energetic check

## The energetic check

## The energetic check

$E(i, l, u)=h_{i} \cdot \max (0, \min ($

## The energetic check

$E(i, l, u)=h_{i} \cdot \max (0, \min (u-l$,

## The energetic check

$E(i, l, u)=h_{i} \cdot \max \left(0, \min \left(u-l, p_{i}\right.\right.$,

## The energetic check

$E(i, l, u)=h_{i} \cdot \max \left(0, \min \left(u-l, p_{i}, \mathrm{est}_{i}+p_{i}-l\right.\right.$.

## The energetic check

$E(i, l, u)=h_{i} \cdot \max \left(0, \min \left(u-l, p_{i}\right.\right.$, est $\left.\left._{i}+p_{i}-l, u-\left(\operatorname{lct}_{i}-p_{i}\right)\right)\right)$

## The energetic check

$$
\begin{aligned}
E(i, l, u) & =h_{i} \cdot \max \left(0, \min \left(u-l, p_{i}, \text { est }_{i}+p_{i}-l, u-\left(\operatorname{lct}_{i}-p_{i}\right)\right)\right) \\
S(l, u) & =C \cdot(u-l)-\sum_{i} E(i, l, u)
\end{aligned}
$$

## The energetic check

$$
\begin{aligned}
E(i, l, u) & =h_{i} \cdot \max \left(0, \min \left(u-l, p_{i}, \text { est }_{i}+p_{i}-l, u-\left(\operatorname{lct}_{i}-p_{i}\right)\right)\right) \\
S(l, u) & =C \cdot(u-l)-\sum_{i} E(i, l, u)
\end{aligned}
$$

## The energetic check

$$
\begin{aligned}
E(i, l, u) & =h_{i} \cdot \max \left(0, \min \left(u-l, p_{i}, \text { est }_{i}+p_{i}-l, u-\left(\text { lct }_{i}-p_{i}\right)\right)\right) \\
S(l, u) & =C \cdot(u-l)-\sum_{i} E(i, l, u) \geq 0
\end{aligned}
$$

## Existing checkers

- Baptiste, Le Pape, and Nuijten showed that it is sufficient to test $\mathrm{O}\left(\mathrm{n}^{2}\right)$ intervals.

## Existing checkers

- Baptiste, Le Pape, and Nuijten showed that it is sufficient to test $\mathrm{O}\left(\mathrm{n}^{2}\right)$ intervals.
- The slack $\mathrm{S}(\mathrm{I}, \mathrm{u})$ is computed in constant time, using the previous computation of $S(I, u-1)$.

## Existing checkers

- Baptiste, Le Pape, and Nuijten showed that it is sufficient to test $O\left(n^{2}\right)$ intervals.
- The slack $\mathrm{S}(\mathrm{I}, \mathrm{u})$ is computed in constant time, using the previous computation of $S(I, u-1)$.
- Running time complexity: $\mathrm{O}\left(\mathrm{n}^{2}\right)$

## Existing checkers

- Baptiste, Le Pape, and Nuijten showed that it is sufficient to test $\mathrm{O}\left(\mathrm{n}^{2}\right)$ intervals.
- The slack $\mathrm{S}(\mathrm{I}, \mathrm{u})$ is computed in constant time, using the previous computation of $S(I, u-1)$.
- Running time complexity: $\mathrm{O}\left(\mathrm{n}^{2}\right)$
- Derrien and Petit reduced the multiplicative constant by a factor of 7 .

## Goal

- To perform the energetic check in sub-quadratic time.
- We need to test fewer than $O\left(n^{2}\right)$ intervals
- We will need to compute the slack, upon request, for any time interval $[I, \mathrm{u}$ )

## Goal

- To perform the energetic check in sub-quadratic time.
- We need to test fewer than $O\left(n^{2}\right)$ intervals
- We will need to compute the slack, upon request, for any time interval $[I$, u)

## Advice \#1

## Reduce your problem to one that is already solved.

- Reductions can provide solutions out of the box.
- If not, they give a direction how to adapt a solution to your problem.
- Take time to reformulate your problem using different abstractions: graphs, points/vectors, ...

## Reduction

## Reduction

## Reduction

## Reduction

## Reduction

## Reduction

## Reduction

## Reduction

## Reduction

## Reduction

## Reduction

## Reduction

## Range trees

- Given $n$ points
- Build a range tree in $O(n \log n)$ space and time
- Count number of points in any given box in O(log n) time
- Since there are multiple points associated to a single task, adaptations are required to remain strongly polynomial in space and time.

## How to check fewer than $O\left(n^{2}\right)$ intervals?

- Recall that the slack is computed as follows.

$$
S(l, u)=C \cdot(u-l)-\sum_{i} E(i, l, u)
$$

- Goal: Find a time interval $[I, u]$ such that $S(I, u)<0$ while sampling fewer than $O\left(n^{2}\right)$ intervals or guaranty that there is no such interval.

## Advice \#2

## Increase your capacity to solve

 problems: learn new things every day.

## Monge matrix

- A matrix M has the Monge property if and only if

$$
M[i+1, j+1]-M[i+1, j] \geq M[i, j+1]-M[i, j]
$$

## Monge matrix

- A matrix M has the Monge property if and only if

$$
M[i+1, j+1]-M[i+1, j] \geq M[i, j+1]-M[i, j]
$$

- I did not get that out from a hat. I learned it 15 years ago!

## Monge matrix

- A matrix M has the Monge property if and only if

$$
M[i+1, j+1]-M[i+1, j] \geq M[i, j+1]-M[i, j]
$$

- I did not get that out from a hat. I learned it 15 years ago!
- The Monge property can make many problems easier:

## Monge matrix

- A matrix M has the Monge property if and only if

$$
M[i+1, j+1]-M[i+1, j] \geq M[i, j+1]-M[i, j]
$$

- I did not get that out from a hat. I learned it 15 years ago!
- The Monge property can make many problems easier:
- Finding the smallest element on every row of a Monge matrix can be done in linear time!

## Monge matrix

- A matrix M has the Monge property if and only if

$$
M[i+1, j+1]-M[i+1, j] \geq M[i, j+1]-M[i, j]
$$

- I did not get that out from a hat. I learned it 15 years ago!
- The Monge property can make many problems easier:
- Finding the smallest element on every row of a Monge matrix can be done in linear time!
- Solving the Traveling Salesman Problem can be done linear time!

## Inverse Monge matrix

Inverse

- A matrix $M$ has the Monge property if and only if

$$
M[i+1, j+1]-M[i+1, j] \geq M[i, j+1]-M[i, j]
$$

- I did not get that out from a hat. I learned it $\mathbf{1 5}$ years ago!
- The Monge property can make many problems easier:
- Finding the smallest element on every row of a Monge matrix can be done in linear time!
- Solving the Traveling Salesman Problem can be done linear time!

## Inverse Monge matrix

$$
M[i+1, j+1]-M[i+1, j] \geq M[i, j+1]-M[i, j]
$$

- To understand the intuition of Monge matrices, consider the $\mathrm{i}^{\text {th }}$ row of a matrix as a function $\mathrm{f}_{\mathrm{i}}$.

$$
\frac{f_{i+1}(x+1)-f_{i+1}(x)}{(x+1)-x} \geq \frac{f_{i}(x+1)-f_{i}(x)}{(x+1)-x}
$$

- Function $\mathrm{f}_{\mathrm{i}+1}$ grows faster than function $\mathrm{f}_{\mathrm{i}}$.
- Consequently, both functions cross each other only once.
- The crossing point (or region) can be computed with a binary search.

## Complexity

- If the matrix had dimension $n \times n$, there would be

## Complexity

- If the matrix had dimension $n \times n$, there would be
- $O(n)$ binary searches

## Complexity

- If the matrix had dimension $n \times n$, there would be
- $O(n)$ binary searches
- O( $n \log n$ ) comparisons

## Complexity

- If the matrix had dimension $n \times n$, there would be
- $O(n)$ binary searches
- O( $n$ log $n$ ) comparisons
- Computing an entry of the matrix takes $\mathrm{O}(\log n)$

## Complexity

- If the matrix had dimension $n \times n$, there would be
- $O(n)$ binary searches
- O( $n$ log $n$ ) comparisons
- Computing an entry of the matrix takes $\mathrm{O}(\log n)$
- Overall complexity: $\mathrm{O}\left(n \log ^{2} n\right)$

## Complexity

- If the matrix had dimension $n \times n$, there would be
- $O(n)$ binary searches
- O( $n \log n$ ) comparisons
- Computing an entry of the matrix takes $\mathrm{O}(\log n)$
- Overall complexity: $\mathrm{O}\left(n \log ^{2} n\right)$
- But the dimension is not $n \times n \ldots$

## Complexity

- If the matrix had dimension $n \times n$, there would be
- $O(n)$ binary searches
- O( $n$ log $n$ ) comparisons
- Computing an entry of the matrix takes $\mathrm{O}(\log n)$
- Overall complexity: $\mathrm{O}\left(n \log ^{2} n\right)$
- But the dimension is not $n \times n \ldots$
- To obtain a complexity of $O\left(n \log ^{2} n\right)$, the algorithm only analyzes a subset of $O\left(n^{2}\right)$ cells characterized by Derrien and Petit.

## Advice \#3

## Make your research practical!

- If you want your graduate studies to leverage your industrial career, work on something practical.
- You prefer an academic career? Having industrial partners will help fund your lab.
- You prefer theory? No problem! Be prepared to justify with applications.
- Implement your ideas!

## What we learned when implementing the algorithm

- A large portion of the computation is spent computing entries in the slack matrix.
- Adding a cache prevents computing twice the same slack and save computation time.
- Derrien et Petit reduced the number of intervals of interests by a factor 7. This makes a huge difference for our checker as well.

Time to solve to optimality (PSBLIB)

## Next steps

- Running time analysis of the filtering algorithm

## Next steps

- Running time analysis of the filtering algorithm
- Worst case: $\mathrm{O}\left(\mathrm{n}^{2} \log ^{2} \mathrm{n}\right)$

## Next steps

- Running time analysis of the filtering algorithm
- Worst case: $\mathrm{O}\left(\mathrm{n}^{2} \log ^{2} \mathrm{n}\right)$

We believe this bound is not tight

## Next steps

- Running time analysis of the filtering algorithm
- Worst case: $O\left(n^{2} \log ^{2} n\right)$

We believe this bound is not tight

- Average case: O(n² log n)

## Next steps

- Running time analysis of the filtering algorithm
- Worst case: $O\left(n^{2} \log ^{2} n\right)$

We believe this bound is not tight

- Average case: $O\left(n^{2} \log n\right)$ We believe this bound is not tight

## Next steps

- Running time analysis of the filtering algorithm
- Worst case: $O\left(n^{2} \log ^{2} n\right)$

We believe this bound is not tight We believe this bound is not tight

- Nogood learning

## Advice \#4

## Share your ideas

## Conclusion

- Range trees are convenient to compute the amount of energy in a given time interval.
- The Monge property appears in scheduling problems and can be exploited.
- Energetic check in $\mathrm{O}\left(\mathrm{n} \log ^{2} \mathrm{n}\right)$ time.

## Advice \#1

## Reduce your problem to one that is already solved.

## Advice \#2

Increase your capacity to solve problems: learn new things every day.

# Advice \#3 

Make it practical!
